Overview of Pi-Star Auto AP boot-up steps for a new wireless network

1. Computer WiFi is connected to your wireless network. Power on the Pi-Star hotspot to start the boot-up process.

2. After boot-up, Pi-Star begins looking for known wireless networks.

3. If no known network found within 2 mins, Pi-Star Auto AP (requires RPi 3B, Zero, or newer) creates an access point: name = Pi-Star-Setup; pwd = raspberry.

4. Connect computer WiFi to Pi-Star-Setup. In computer browser, go to Pi-Star > Configuration > Wireless Configuration, and add your wireless network.

5. Power off and then restart Pi-Star hotspot. While restarting, reconnect computer WiFi to wireless network.

6. After Pi-Star hotspot reboots, Auto AP will connect to now known wireless network. In computer browser, go to http://pi-star.local/ or http://pi-star/.
